OPTOMAP RETINA SCREENING

We are proud to offer a new technology to our clinic, the OPTOS DAYTONA. The Optos Daytona is a scanning laser retina imaging system that offers an ultra-wide field digital image, called an OPTOMAP. This image covers more than 80% of the retina inside of the eye. This makes it possible to diagnose eye disease early. Our doctors believe the OPTOMAP to be an essential addition to an eye exam and prescribe it for all patients annually.

The OPTOMAP screening does not replace the dilation of the pupils.

The OPTOMAP screening is not covered by insurance, and is a $39.00 fee payable today, and your doctor will review the images with you as part of your exam.

☐ Yes, I would like to have an OPTOMAP retina screening today
☐ I am declining the OPTOMAP retina screening

Please note:
When disease exists, or is discovered inside of the eyes, we will then photo-document the pathology so that we can monitor it for progression over time. Under these circumstances, we will bill imaging as part of our normal medical charges which can be submitted to your medical insurance for payment.
